## Telehealth visit for underwriting/claims

Telehealth visit generates important applicant/claimant-disclosed information that may be missing from the application.

### UNIQUE BENEFITS

Hit rates of 85%+ with more complete view of the applicant's health history

Fits multiple underwriting and claims workflows

Improve client engagement on the basis of a 1-on-1 connection with a clinician

### WEARABLES: A GAME CHANGER FOR DYNAMIC UNDERWRITING

Embracing the insurance opportunities offered by digital technology, SCOR Global Life partners with Vivametrika to develop a new risk model based on data from wearable devices.

As technology evolves, reliable data from wearable devices should streamline and accelerate life insurance underwriting, with multiple benefits for customers. In this regard, SCOR Global Life and Vivametrika, a Canadian Insurtech company specializing in health analytics, have signed a partnership agreement to co-develop an exclusive Mortality and Critical Illness risk model designed to assess the "biological age" of individuals, based on the continuous data provided by their wearable devices.

#### Stratifying mortality risk using physical activity as measured by wearable sensors

##### Using wearables for insurance risk assessment

Wearable technology refers to electronic devices with sensors, typically worn on the body, that collect and deliver information about their surroundings. Generally, the wearable device is a wristband or watch, although the technology has expanded to jewelry, glasses, clothing, and shoes. The accelerometers in activity trackers are also found in smartphones, allowing phones to track user activity even without a separate wearable device. These devices can be simple tools for tracking metrics associated with physical activity: step count, speed,

from qualifying for the best risk classes, mitigating mortality risk.

- Traditional full underwriting: use physical activity as additional underwriting criteria, improving mortality experience.
- Customer engagement and awareness: develop rewards programs to cultivate healthy lifestyle choices, resulting in reduced healthcare expenses.

Companies interested in adopting a wearables-based program should be transparent about the use of data, including what information is captured, stored, and shared, and how the data is used. It is also

important to evaluate the extent to which physical activity predicts mortality.

Wearable sensors measure the level of physical activity through step count and minutes of moderate to vigorous activity per day. Munich Re's analysis found that steps per day can effectively segment mortality risk even after controlling for age, gender, smoking status and various health indicators. Insurers

# "The Big Six" Lifestyle Factors

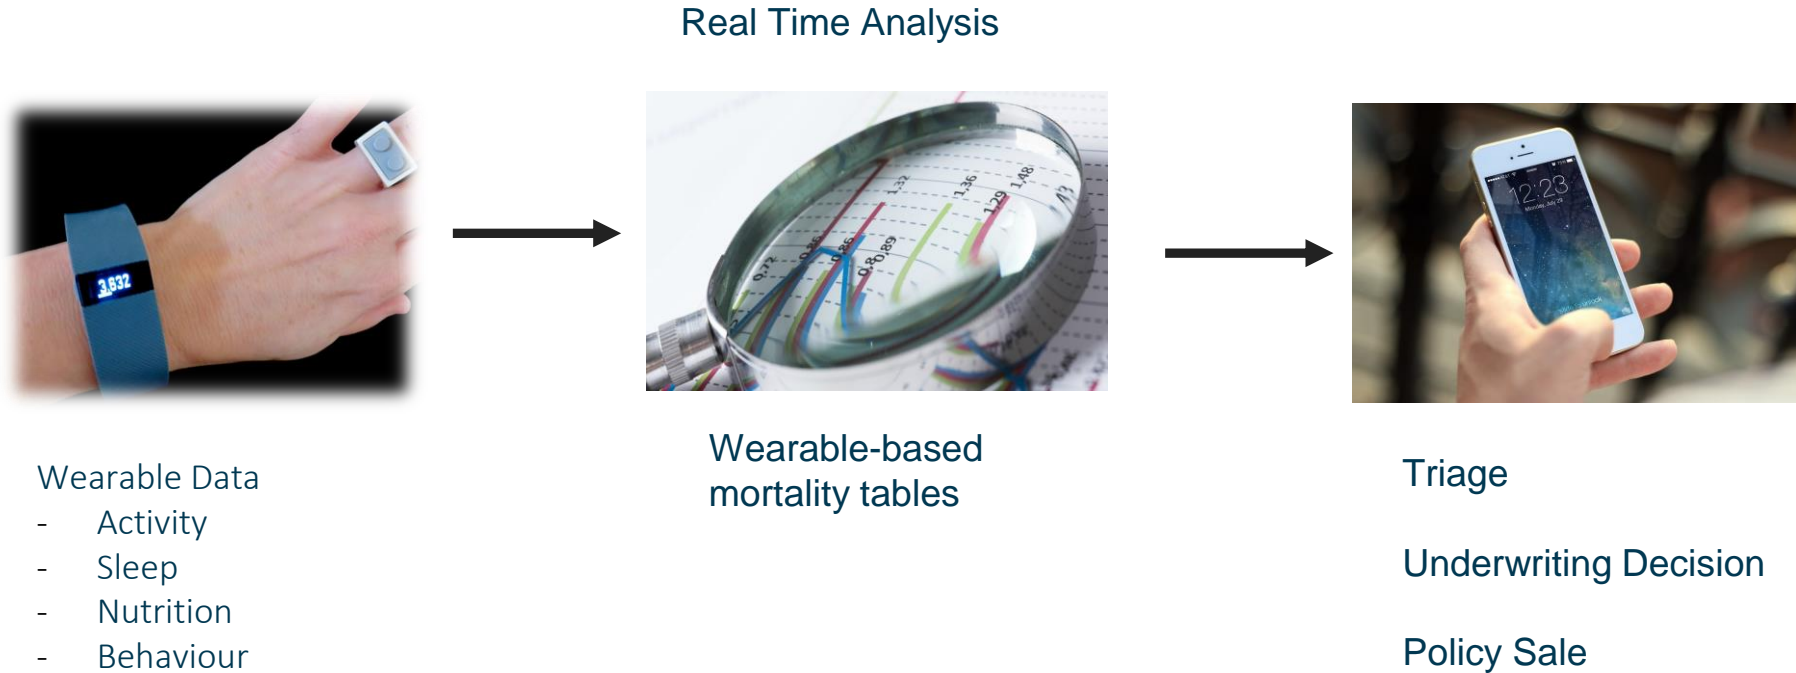

## The new frontier for risk assessment

Can lifestyle risk factors provide a more accurate – or alternative – risk assessment to create a better experience for your customers?

We think so.

# Life Underwriting Use Case

## Stratifying mortality risk using physical activity as measured by wearable sensors

### Using wearables for insurance risk assessment

Wearable technology refers to electronic devices with sensors, typically worn on the body, that collect and deliver information about their surroundings. Generally, the wearable device is a wristband or watch, although the technology has expanded to jewelry, glasses, clothing, and shoes. The accelerometers in activity trackers are also found in smartphones, allowing phones to track user activity even without a separate wearable device. These devices can be simple tools for tracking metrics associated with physical activity: step count, speed,

from qualifying for the best risk classes, mitigating mortality risk.

- Traditional full underwriting: use physical activity as additional underwriting criteria, improving mortality experience.
- Customer engagement and awareness: develop rewards programs to cultivate healthy lifestyle choices, resulting in reduced healthcare expenses.

Companies interested in adopting a wearables-based program should be transparent about the use of data, including what information is captured, stored, and shared, and how the data is used. It is also important to note concerns around

niques to evaluate the extent to which physical activity predicts mortality.

Wearable sensors measure the level of physical activity through step count and minutes of moderate to vigorous activity per day. Munich Re's analysis found that steps per day can effectively segment mortality risk even after controlling for age, gender, smoking status and various health indicators. Insurers

### Vivametrica

*Vivametrica is a health analytics company that provides measurement of mortality and chronic disease risk using digital biomarkers developed*

**Figure 6. Variable Importance**

**Figure 1. Relative A/E Mortality by Average Steps per Day**

## KEY FINDINGS

Primary high-level findings include the following:

- Physical activity as measured by steps per day effectively stratifies mortality risk.
- Steps per day is an important predictor of mortality risk, and may be especially effective in identifying high mortality risk for sedentary behavior.
- Steps per day provides additional segmentation of mortality even after considering traditional underwriting attributes, such as smoking status, BMI, cholesterol, blood pressure and health history of diabetes, cardiovascular disease and cancer.

POWERFUL SOLUTION CAPABILITIES

# Dynamic Actionable Data Insights

State-of-the-art capabilities to collect data, analyze behaviors & create actionable flows.

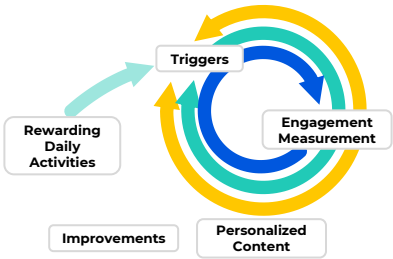

EXAMPLES

# Optimity Health Grade™

Optimity Health Grade™	52.1 out of 100
